

Lake Research Meeting
May 29, 2018

Collaborators from the University of Wisconsin-Madison, University of Wisconsin-Stevens Point, and Wisconsin Department of Natural Resources are looking into the effects of bass and panfish populations on walleye success in northern Wisconsin. This summer, we will remove as many bass and panfish as possible from McDermott Lake and see how the walleye population responds. In response to these fish removals, we would like to offer a chance for the public to hear about our experiment as well as ask any questions relevant to our project on May 29th at 6pm at Sherman Town Hall in Springstead, WI.
